

## 4-Mbit (256K x 16) Static RAM

### Features

- Very high speed: 45 ns
- Temperature ranges
  - Industrial: -40°C to +85°C
  - Automotive-A: -40°C to +85°C
  - Automotive-E: -40°C to +125°C
- Wide voltage range: 2.20V–3.60V
- Pin compatible with CY62147DV30
- Ultra low standby power
  - Typical standby current: 1  $\mu$ A
  - Maximum standby current: 7  $\mu$ A (Industrial)
- Ultra low active power
  - Typical active current: 2 mA @ f = 1 MHz
- Easy memory expansion with  $\overline{CE}$  and  $\overline{OE}$  features
- Automatic power down when deselected
- CMOS for optimum speed and power
- Offered in Pb-free 48-ball VFBGA and 44-pin TSOPII packages
- Byte power down feature

### Functional Description <sup>[1]</sup>

The CY62147EV30 is a high performance CMOS static RAM organized as 256K words by 16 bits. This device features

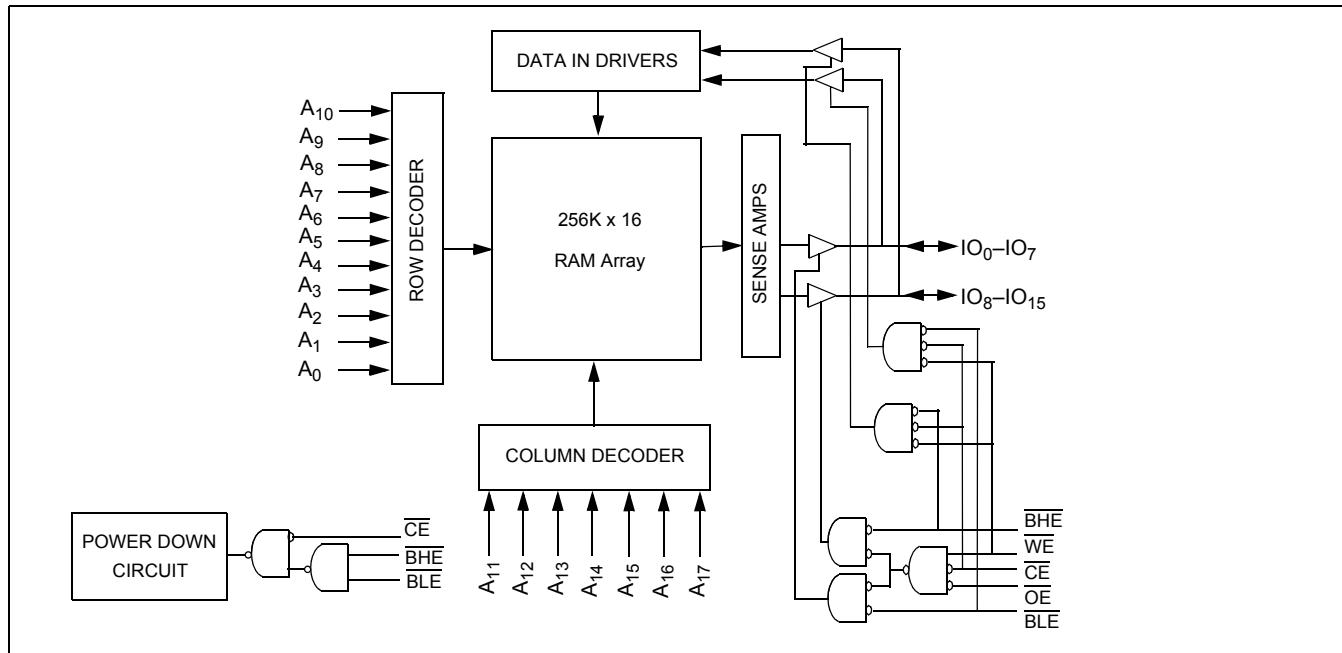

advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption when addresses are not toggling. Placing the device into standby mode reduces power consumption by more than 99% when deselected (CE HIGH or both BHE and BLE are HIGH). The input and output pins ( $IO_0$  through  $IO_{15}$ ) are placed in a high impedance state when:

- Deselected ( $\overline{CE}$  HIGH)
- Outputs are disabled ( $\overline{OE}$  HIGH)
- Both Byte High Enable and Byte Low Enable are disabled (BHE, BLE HIGH)
- Write operation is active ( $\overline{CE}$  LOW and  $\overline{WE}$  LOW)

To write to the device, take Chip Enable ( $\overline{CE}$ ) and Write Enable ( $\overline{WE}$ ) inputs LOW. If Byte Low Enable (BLE) is LOW, then data from IO pins ( $IO_0$  through  $IO_7$ ) is written into the location specified on the address pins ( $A_0$  through  $A_{17}$ ). If Byte High Enable (BHE) is LOW, then data from IO pins ( $IO_8$  through  $IO_{15}$ ) is written into the location specified on the address pins ( $A_0$  through  $A_{17}$ ).

To read from the device, take Chip Enable ( $\overline{CE}$ ) and Output Enable ( $\overline{OE}$ ) LOW while forcing the Write Enable ( $\overline{WE}$ ) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins appear on  $IO_0$  to  $IO_7$ . If Byte High Enable (BHE) is LOW, then data from memory appears on  $IO_8$  to  $IO_{15}$ . See the “[Truth Table](#) on page 9” for a complete description of read and write modes.

### Logic Block Diagram

#### Note

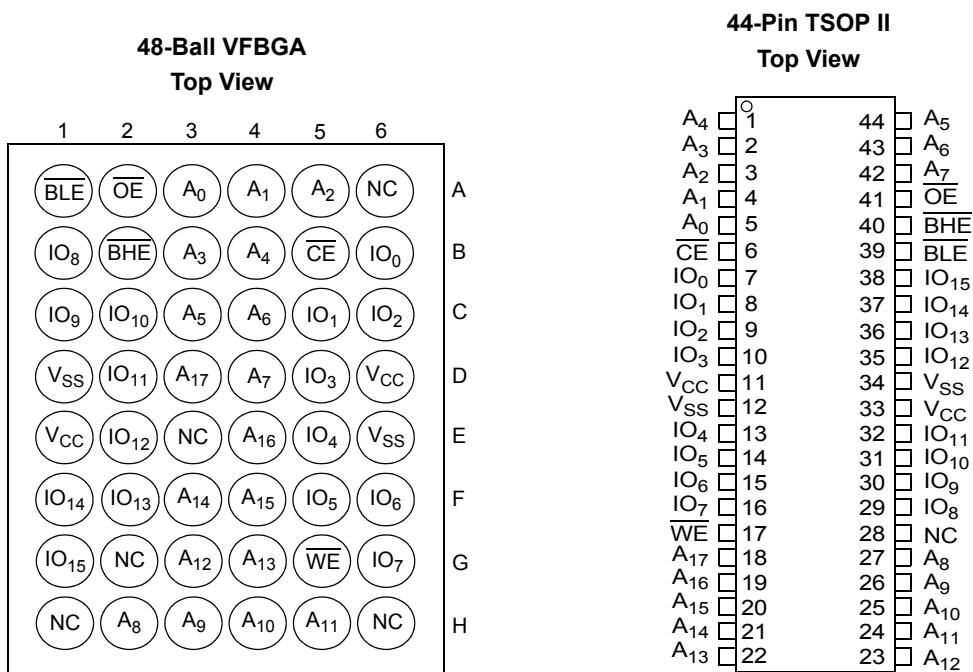

- For best practice recommendations, refer to the Cypress application note AN1064, SRAM System Guidelines.

## Product Portfolio

| Product       | Range        | $V_{CC}$ Range (V) |                    |     | Speed<br>(ns) | Power Dissipation       |     |               |    |                              |    |
|---------------|--------------|--------------------|--------------------|-----|---------------|-------------------------|-----|---------------|----|------------------------------|----|
|               |              |                    |                    |     |               | Operating $I_{CC}$ (mA) |     |               |    | Standby $I_{SB2}$ ( $\mu$ A) |    |
|               |              | Min                | Typ <sup>[2]</sup> | Max |               | $f = 1\text{MHz}$       |     | $f = f_{max}$ |    |                              |    |
| CY62147EV30LL | Ind'l/Auto-A | 2.2                | 3.0                | 3.6 | 45 ns         | 2                       | 2.5 | 15            | 20 | 1                            | 7  |

## Pin Configurations

The figure that follows show the 48-ball VFBGA and 44-pin TSOP II pinouts.<sup>[3, 4]</sup>

### Notes

2. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at  $V_{CC} = V_{CC(\text{typ})}$ ,  $T_A = 25^\circ$ .
3. NC pins are not connected on the die.
4. Pins H1, G2, and H6 in the BGA package are address expansion pins for 8 Mb, 16 Mb, and 32 Mb, respectively.

## Maximum Ratings

Exceeding the maximum ratings may shorten the battery life of the device. User guidelines are not tested.

Storage Temperature ..... $-65^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$

Ambient Temperature with

Power Applied ..... $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$

Supply Voltage to Ground

Potential ..... $-0.3\text{V}$  to  $+3.9\text{V}$  ( $V_{CC\max} + 0.3\text{V}$ )

DC Voltage Applied to Outputs  
in High-Z State [5, 6] ..... $-0.3\text{V}$  to  $3.9\text{V}$  ( $V_{CC\max} + 0.3\text{V}$ )

DC Input Voltage [5, 6] ..... $-0.3\text{V}$  to  $3.9\text{V}$  ( $V_{CC\max} + 0.3\text{V}$ )

Output Current into Outputs (LOW) ..... $20\text{ mA}$

Static Discharge Voltage ..... $>2001\text{V}$   
(MIL-STD-883, Method 3015)

Latch up Current ..... $>200\text{ mA}$

## Operating Range

| Device        | Range        | Ambient Temperature                             | $V_{CC}$ [7]                   |
|---------------|--------------|---|--------------------------------|
| CY62147EV30LL | Ind'l/Auto-A | $-40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$  | $2.2\text{V}$ to $3.6\text{V}$ |
|               | Auto-E       | $-40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$ |                                |

## Capacitance

For all packages [9]

| Parameter | Description        | Test Conditions                                   | Max | Unit        |
|-----------|--------------------|---|-----|-------------|
| $C_{IN}$  | Input Capacitance  | $T_A = 25^{\circ}\text{C}$ , $f = 1\text{ MHz}$ , | 10  | $\text{pF}$ |
| $C_{OUT}$ | Output Capacitance | $V_{CC} = V_{CC(\text{typ})}$                     | 10  | $\text{pF}$ |

## Notes

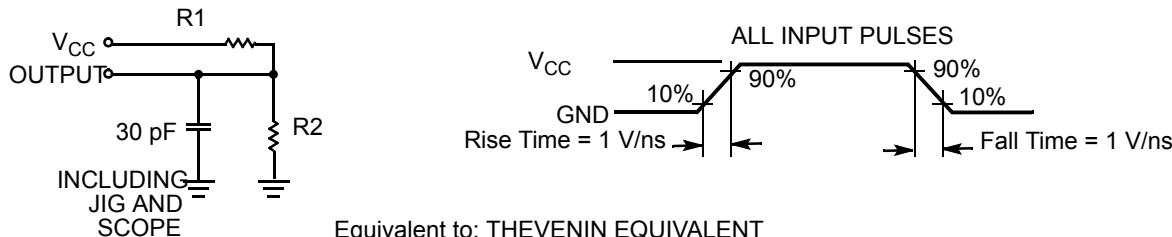

5.  $V_{IL(min)} = -2.0\text{V}$  for pulse durations less than 20 ns.
6.  $V_{IH(max)} = V_{CC} + 0.75\text{V}$  for pulse durations less than 20 ns.
7. Full device AC operation assumes a minimum of 100  $\mu\text{s}$  ramp time from 0 to  $V_{CC(\text{min})}$  and 200  $\mu\text{s}$  wait time after  $V_{CC}$  stabilization.
8. Only chip enable (CE) and byte enables (BHE and BLE) need to be tied to CMOS levels to meet the  $I_{SB2}$  /  $I_{CCDR}$  spec. Other inputs can be left floating.
9. Tested initially and after any design or process changes that may affect these parameters.

### Thermal Resistance<sup>[9]</sup>

| Parameter     | Description                              | Test Conditions  | VFBGA Package | TSOP II Package | Unit |
|---------------|--|--|---------------|-----------------|------|
| $\Theta_{JA}$ | Thermal Resistance (Junction to Ambient) | Still Air, soldered on a 3 × 4.5 inch, two-layer printed circuit board | 75            | 77              | °C/W |
| $\Theta_{JC}$ | Thermal Resistance (Junction to Case)    |  | 10            | 13              | °C/W |

### AC Test Loads and Waveforms

Figure 1. AC Test Load and Waveforms

Equivalent to: THEVENIN EQUIVALENT

| Parameters      | 2.50V | 3.0V | Unit |
|-----------------|-------|------|------|
| R1              | 16667 | 1103 | Ω    |
| R2              | 15385 | 1554 | Ω    |

| t <sub>R</sub> <sup>[10]</sup>    | Operation Recovery Time              |   |              | t <sub>RC</sub>    |     | ns   |         |

### Data Retention Waveform<sup>[11]</sup>

Figure 2. Data Retention Waveform

#### Notes

10. Full device operation requires linear  $V_{CC}$  ramp from  $V_{DR}$  to  $V_{CC(\min)} \geq 100 \mu s$  or stable at  $V_{CC(\min)} \geq 100 \mu s$ .

11. BHE.BLE is the AND of both BHE and BLE. Deselect the chip by either disabling the chip enable signals or by disabling both  $\overline{BHE}$  and  $\overline{BLE}$ .

## Switching Characteristics

### Notes

12. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns (1V/ns) or less, timing reference levels of  $V_{CC(\text{typ})}/2$ , input pulse levels of 0 to  $V_{CC(\text{typ})}$ , and output loading of the specified  $I_{OL}/I_{OH}$  as shown in the "AC Test Loads and Waveforms" on page 4.
13. AC timing parameters are subject to byte enable signals (BHE or BLE) not switching when chip is disabled. See application note AN13842 for further clarification.
14. At any temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$ ,  $t_{HZBE}$  is less than  $t_{LZBE}$ ,  $t_{HZOE}$  is less than  $t_{LZOE}$ , and  $t_{HZWE}$  is less than  $t_{LZWE}$  for any device.
15.  $t_{HZOE}$ ,  $t_{LZCE}$ ,  $t_{HZBE}$ , and  $t_{HZWE}$  transitions are measured when the outputs enter a high impedance state.
16. The internal write time of the memory is defined by the overlap of WE,  $\overline{CE} = V_{IL}$ , BHE, BLE, or both =  $V_{IL}$ . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

## Switching Waveforms

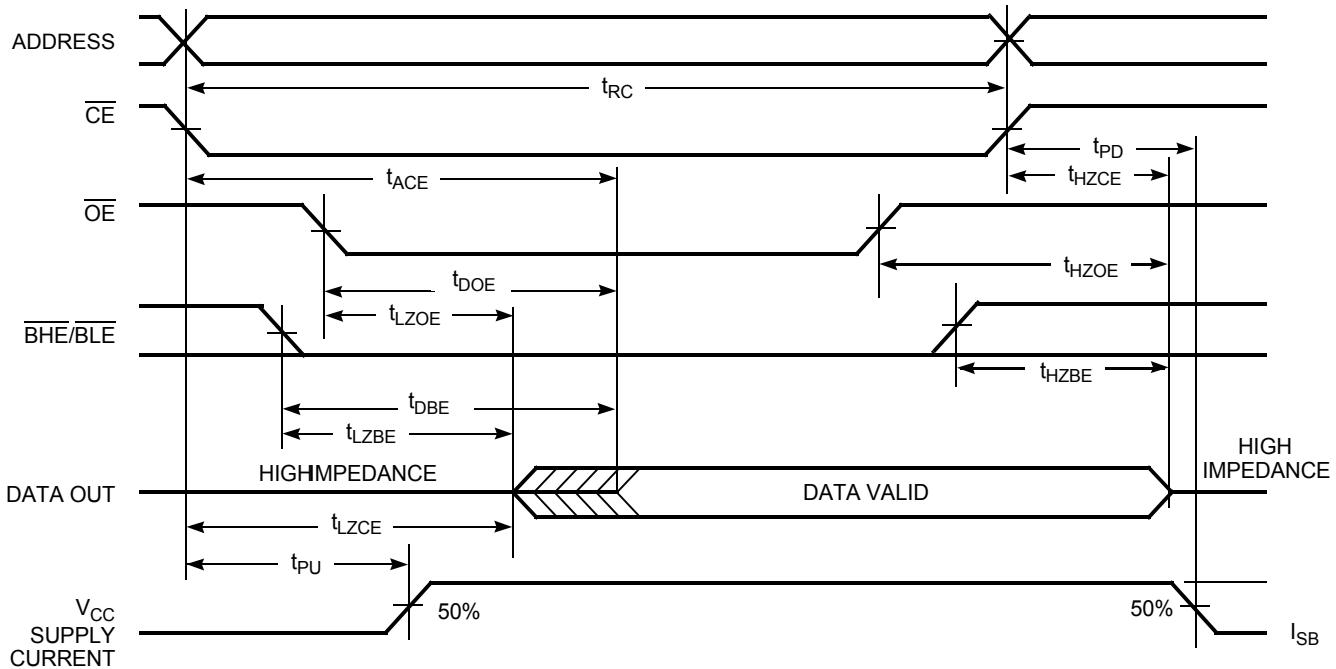

**Read Cycle No. 1 (Address Transition Controlled)<sup>[17, 18]</sup>**

**Figure 3. Read Cycle No. 1**

**Read Cycle No. 2 ( $\overline{OE}$  Controlled)<sup>[18, 19]</sup>**

**Figure 4. Read Cycle No. 2**

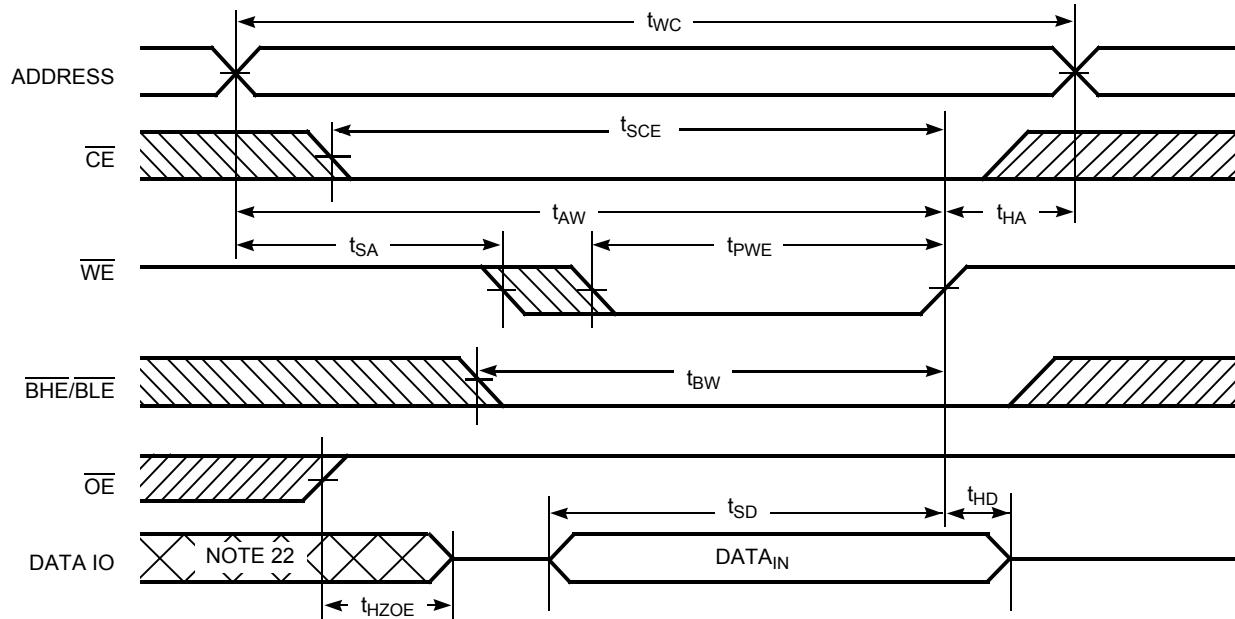

### Notes

17. The device is continuously selected.  $\overline{OE}$ ,  $\overline{CE}$  =  $V_{IL}$ ,  $\overline{BHE}$ ,  $\overline{BLE}$ , or both =  $V_{IL}$ .
18. WE is HIGH for read cycle.
19. Address valid before or similar to  $\overline{CE}$  and  $\overline{BHE}$ ,  $\overline{BLE}$  transition LOW.

## **Switching Waveforms** (continued)

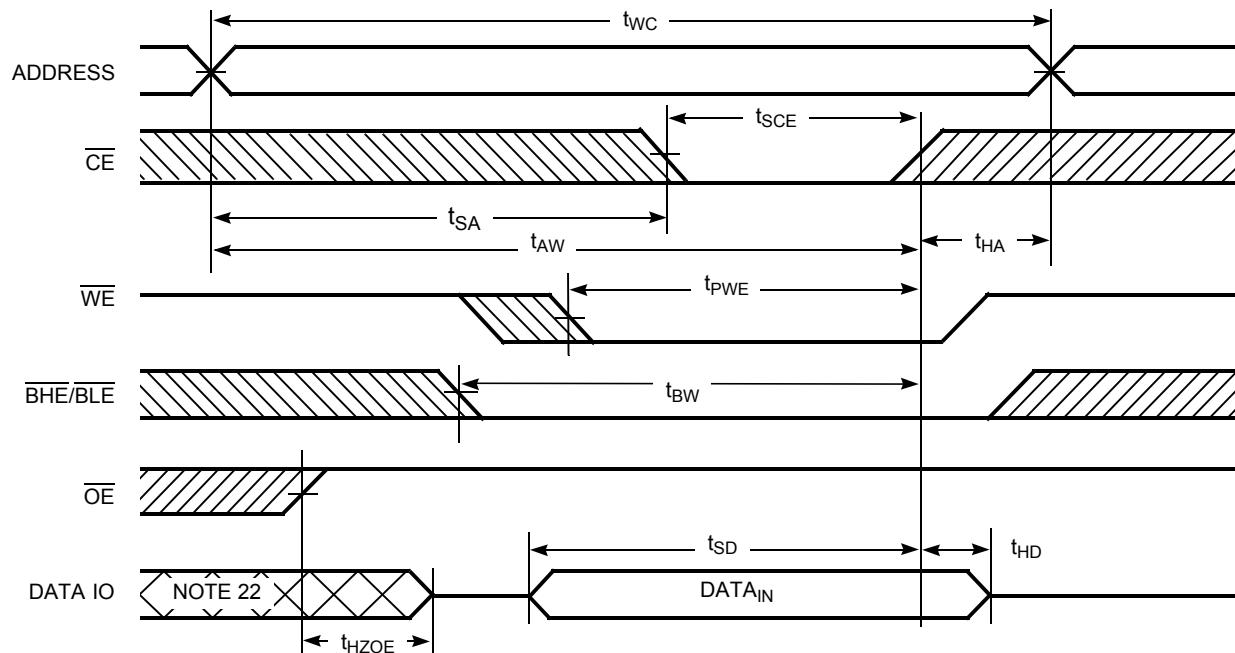

**Write Cycle No. 1 (WE Controlled)**[16, 20, 21]

**Figure 5. Write Cycle No. 1**

## **Write Cycle No. 2 ( $\overline{CE}$ Controlled) [16, 20, 21]**

**Figure 6. Write Cycle No. 2**

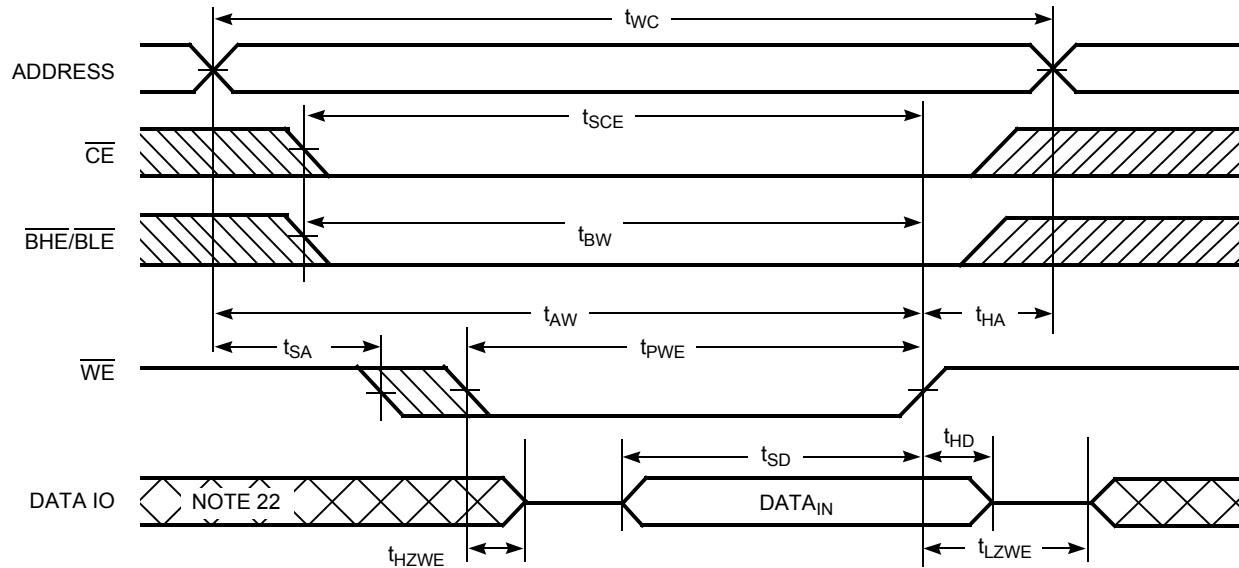

## Notes

20. Data IO is high impedance if  $OE = V_{IH}$ .
  21. If  $CE$  goes HIGH simultaneously with  $WE = V_{IH}$ , the output remains in a high impedance state.
  22. During this period, the IOs are in output state. Do not apply input signals.

### Switching Waveforms (continued)
